

BUILD AN AI TRADING BOT WITH CHATGPT ASTRA

A 5-step research workflow — SCAN → ANALYZE → RESEARCH → RISK → PLAN — that turns ChatGPT (GPT-6 Astra) into your research desk. It produces one structured trade plan. You make the decision.

5 STEPS	6 PROMPTS	0 TRADES AUTO-EXECUTED	100% HUMAN REVIEW
-------------------	---------------------	----------------------------------	-----------------------------

READ THIS FIRST

"Bot" means a repeatable research system, not an auto-trader. Nothing in this guide places trades — no broker API is connected. ChatGPT cannot see your account and can be confidently wrong, so every number gets verified by you. No profits are promised. Educational purposes only, not financial advice.

1 TOOLS YOU NEED

Tool	Why	Default
ChatGPT with GPT-6 Astra	Runs every step. Astra can browse, read chart screenshots, and work with spreadsheets.	Plus, Pro, Business, or Enterprise plan (Astra is not on the free tier as of Sept 2026).
A data source	Real, current numbers. You paste them in — or let Astra fetch and cite them, then you check.	Your broker app + a finance site (e.g. Yahoo Finance) + the company's investor-relations page.
Chart screenshots	For the ANALYZE step.	Daily (6 months) + weekly (2 years) from TradingView or your broker.
A notes doc + sheet	Saves each step's output and your trade plans.	Google Docs + Google Sheets.

Quick setup (3 minutes)

1. Open ChatGPT, confirm the model is GPT-6 Astra. Create a Project called "Trading Research".
2. Paste the Master Prompt (Section 3) into the Project instructions so every chat starts with the rules.
3. Make a Google Doc with five headings: SCAN, ANALYZE, RESEARCH, RISK, PLAN. One doc per stock.
4. Decide two numbers now and never change them mid-trade: your account size and your max risk per trade (beginners: 0.5–1%).

2 THE 5 STEPS

Each step feeds the next. Run them in order, paste the previous output in, and review before moving on.

STEP 1 — SCAN

Goal: Find potential setups worth a closer look.

Paste: today's movers, sector news, or your watchlist — with date and source. Or tell Astra to fetch and cite.

COPY / PASTE PROMPT

You are my SCANNER. Find 3–5 stocks worth deeper research — not winners.

Market data / watchlist (dated, with source): [PASTE — or "fetch today's top movers and cite each source with a timestamp"]

My style: [swing 2–20 days / long-term / day trade]

For each candidate: TICKER — what the company does (one line) — why it's interesting right now, from the data — the biggest reason to skip it — what to research next.

Rank by clarity of setup, not expected return. End with: which ONE to research first, and why.

RULES: Use only the data I pasted (or data you fetched and cited with a source + timestamp). Never invent a price, number, date, or headline — missing = "NOT PROVIDED — verify manually". Keep FACTS (from data, with source) separate from OPINION (your read). End with CONFIDENCE: Low / Medium / High. No profit promises, no buy/sell instructions. Educational research only; a human reviews everything before any trade.

STEP 2 — ANALYZE

Goal: Read the chart: trend, momentum, support, resistance, price action.

Paste: daily + weekly chart screenshots, current price, recent volume.

COPY / PASTE PROMPT

You are my CHART ANALYST for [TICKER]. Price and volume only.

Current price: [PRICE] on [DATE]. Charts attached: [DAILY 6M, WEEKLY 2Y].

Describe only what is visible:

1. TREND — up / down / sideways on each timeframe (higher highs? lower lows?)
2. MOMENTUM — speeding up or fading? volume rising on up days or down days?
3. SUPPORT — nearest level below price where buyers stepped in before, and why.
4. RESISTANCE — nearest level above where sellers showed up, and why.
5. PRICE ACTION — breakouts, breakdowns, gaps, big-volume days, tight ranges.

Output: FACTS (what you see, approximate levels) → OPINION: Bullish / Neutral / Bearish, the two levels that matter, and what flips your read. If a chart is unclear or missing, say so.

RULES: Use only the data I pasted (or data you fetched and cited with a source + timestamp). Never invent a price, number, date, or headline — missing = "NOT PROVIDED — verify manually". Keep FACTS (from data, with source) separate from OPINION (your read). End with CONFIDENCE: Low / Medium / High. No profit promises, no buy/sell instructions. Educational research only; a human reviews everything before any trade.

STEP 3 — RESEARCH

Goal: Understand the business: financials, earnings, news, and upcoming catalysts.

Paste: latest earnings numbers, key stats, 3–5 dated headlines. Or tell Astra to fetch and cite them.

COPY / PASTE PROMPT

You are my RESEARCH ANALYST for [TICKER].

Data (dated, with source): [PASTE FINANCIALS, EARNINGS, KEY STATS, NEWS — or "fetch from the company's investor-relations page and a finance site; cite every figure"]

1. FINANCIALS — revenue, growth, margins, debt vs. cash. Stronger or weaker?
2. EARNINGS — last report: beat or miss? guidance? NEXT EARNINGS DATE (timing risk).
3. NEWS — 3 most important recent items; each marked CONFIRMED or RUMOR, with date and source.
4. CATALYSTS — dated events in the next 60 days that could move the stock.

Output: FACTS table (metric | value | date | source) → OPINION: bull case (3 bullets), bear case (3 bullets), Business looks Strong / Average / Weak.

RULES: Use only the data I pasted (or data you fetched and cited with a source + timestamp). Never invent a price, number, date, or headline — missing = "NOT PROVIDED — verify manually". Keep FACTS (from data, with source) separate from OPINION (your read). End with CONFIDENCE: Low / Medium / High. No profit promises, no buy/sell instructions. Educational research only; a human reviews everything before any trade.

STEP 4 — RISK

Goal: Calculate risk/reward, position size, stop loss, and invalidation.

Paste: Steps 2 + 3 outputs, account size, max risk per trade.

COPY / PASTE PROMPT

You are my RISK MANAGER for [TICKER]. Protect capital and attack the idea.

Account: [AMOUNT]. Max risk per trade: [X]%. Current price: [PRICE] on [DATE].

Chart analysis: [PASTE STEP 2] Research: [PASTE STEP 3]

1. STOP LOSS — the price where the idea is wrong, based on chart support. Why there?
2. POSITION SIZE — show the math: $(\text{account} \times \text{risk } \%) \div (\text{entry} - \text{stop}) = \text{shares}$. Then \$ value and % of account.
3. RISK / REWARD — target = nearest resistance: $(\text{target} - \text{entry}) \div (\text{entry} - \text{stop})$. Under 2:1 = not worth it at this price; say so.
4. INVALIDATION — 3 things that cancel the idea before the stop is hit (a level break, an earnings date, a news event).
5. WEAKEST ASSUMPTION — the shakiest claim in the chart or research work.

Output: FACTS (the math, step by step) → OPINION: Risk/reward Favorable / Even / Poor, plus the single biggest risk.

RULES: Use only the data I pasted (or data you fetched and cited with a source + timestamp). Never invent a price, number, date, or headline — missing = "NOT PROVIDED — verify manually". Keep FACTS (from data, with source) separate from OPINION (your read). End with CONFIDENCE: Low / Medium / High. No profit promises, no buy/sell instructions. Educational research only; a human reviews everything before any trade.

STEP 5 — PLAN

Goal: Combine everything into one structured trade plan for human review.

Paste: all four previous outputs.

COPY / PASTE PROMPT

You are my TRADE PLANNER for [TICKER]. Combine the four reports into ONE plan for my review. Add no new facts — if something is missing, say so.

SCAN: [PASTE] ANALYZE: [PASTE] RESEARCH: [PASTE] RISK: [PASTE]

Fill in exactly this template, under one page:

TRADE PLAN — [TICKER] — [DATE]

THESIS (one sentence) · DIRECTION & TIMEFRAME · ENTRY (price or condition) · STOP (price + why) ·

TARGET 1 / TARGET 2 · POSITION SIZE (shares, \$, % of account, \$ at risk) · RISK/REWARD ·

INVALIDATION (3) · KEY DATES · WHERE CHART AND RESEARCH DISAGREE · CONFIDENCE + what changes it · NUMBERS TO VERIFY

STATUS: AWAITING HUMAN REVIEW — nothing is executed until I approve it.

RULES: Use only the data I pasted (or data you fetched and cited with a source + timestamp). Never invent a price, number, date, or headline — missing = "NOT PROVIDED — verify manually". Keep FACTS (from data, with source) separate from OPINION (your read). End with CONFIDENCE: Low / Medium / High. No profit promises, no buy/sell instructions. Educational research only; a human reviews everything before any trade.

3 MASTER PROMPT — RUN THE WHOLE WORKFLOW

Paste this into your Project instructions (or at the top of a chat). Astra runs all five steps in order and stops for your review at the end.

COPY / PASTE PROMPT

You are my AI TRADING RESEARCH DESK, running on GPT-6 Astra. For [TICKER], run this workflow in order and label each step: SCAN → ANALYZE → RESEARCH → RISK → PLAN. Complete each step fully before starting the next.

MY DATA (dated, with sources): Market / watchlist: [PASTE] Financials, earnings, key stats: [PASTE] News: [PASTE] Charts: [ATTACH DAILY + WEEKLY] Current price: [PRICE] on [DATE] Account: [AMOUNT] Max risk per trade: [X]% Style: [swing / long-term / day]

If I wrote "fetch" for any item, browse for it, cite the source and timestamp for every figure, and flag it [VERIFY].

SCAN: confirm whether [TICKER] is worth researching now — one paragraph; if not, say so and stop.

ANALYZE: trend, momentum, support, resistance, price action — only what is visible. OPINION: Bullish / Neutral / Bearish + the two levels that matter.

RESEARCH: FACTS table (metric | value | date | source); earnings + next earnings date; news marked CONFIRMED / RUMOR; dated catalysts. OPINION: bull case, bear case, Strong / Average / Weak.

RISK: stop from support; position size with the math shown; R:R vs. nearest resistance (under 2:1 = say it isn't worth it); 3 invalidation triggers; weakest assumption.

PLAN: thesis / direction & timeframe / entry / stop / targets / size / R:R / invalidation / key dates / where chart and research disagree / confidence / numbers to verify. End with: STATUS: AWAITING HUMAN REVIEW.

RULES: 1) Never invent a price, number, date, or headline — missing = "NOT PROVIDED — verify manually". 2) Keep FACTS (with source) separate from OPINION in every step. 3) No profit promises and no buy/sell instructions; this is educational research, not financial advice. 4) You do not execute trades and have no broker connection. I review the plan and make every decision.

4 EXAMPLE — WITH MOCK DATA

MOCK DATA

Everything below is **ILLUSTRATIVE**. The ticker "XYZ" is fictional and every number is made up to show the math. Do not trade on it. Your run uses real, dated data you paste in.

\$50.00 ENTRY (MOCK)	\$47.50 STOP (MOCK)	\$57.50 TARGET (MOCK)	3.0 : 1 RISK / REWARD
--------------------------------	-------------------------------	---------------------------------	---------------------------------

Step	Illustrative output
1. SCAN	XYZ flagged: "clear range, catalyst in 3 weeks, volume rising." Reason to skip: earnings inside the trade window.
2. ANALYZE	Weekly uptrend; daily range \$47–\$58. Support ≈ \$48 (tested twice), resistance ≈ \$57.50. OPINION: Neutral-to-Bullish; flips bearish under \$47.
3. RESEARCH	FACTS: revenue growth [mock 12%], margins stable, net cash positive, next earnings in 21 days (mock). OPINION: Business Average; bear case = growth slowing.
4. RISK	Account \$10,000 (mock), risk 1% = \$100. Stop \$47.50 → risk per share \$2.50 → 40 shares = \$2,000 (20% of account). R:R to \$57.50 = $\$7.50 \div \$2.50 = 3.0:1$. Invalidation: close under \$47, earnings gap, guidance cut. Verdict: Favorable.
5. PLAN	Entry: only on a pullback holding \$48–\$50. Stop \$47.50. T1 \$57.50, T2 by reassessment. 40 shares. Confidence: Medium. STATUS: AWAITING HUMAN REVIEW.

Notice the plan doesn't say "buy." It says: this setup only works at this price, with this stop, and here's what cancels it. Then you decide.

5 TRADE-PLAN TEMPLATE

TRADE PLAN – [TICKER] – [DATE]
THESIS: _____
DIRECTION / TIMEFRAME: _____
ENTRY (price or condition): _____
STOP (price + why): _____
TARGET 1 / TARGET 2: _____
POSITION SIZE: ____ shares · \$_____ · ____% of account · \$_____ at risk
RISK / REWARD: ____ : 1
INVALIDATION: 1) _____ 2) _____ 3) _____
KEY DATES (earnings, events): _____
CHART vs. RESEARCH DISAGREEMENT: _____
CONFIDENCE: Low / Medium / High – changes if: _____
NUMBERS TO VERIFY BEFORE ACTING: _____
STATUS: AWAITING HUMAN REVIEW ☐ Reviewed ☐ Approved ☐ Rejected

6 5-MINUTE QUICK START

- ☐ Open ChatGPT → confirm GPT-6 Astra → create a Project "Trading Research" (1 min)
- ☐ Paste the Master Prompt into the Project instructions (1 min)
- ☐ Set your two numbers: account size + max risk per trade (30 sec)
- ☐ Grab real, dated data for one stock: price, chart screenshots, earnings, 3 headlines (2 min)
- ☐ Paste it in with [TICKER] → read the plan → verify the FACTS table against your sources

NEVER

- ☐ Never let Astra guess a price or a number — "NOT PROVIDED" is the correct answer.
- ☐ Never skip RISK. If R:R is under 2:1, the plan says no.
- ☐ Never trade a plan you haven't read and approved yourself — start with paper trading.
- ☐ Never connect a broker API until you've paper-traded the workflow for weeks and understand every step.

IMPORTANT

Disclaimer. This guide describes an educational research workflow. It does not execute trades, connect to any broker, predict prices, or provide financial, investment, or tax advice. AI models can produce incorrect or fabricated information — verify every figure independently. No profit or return is promised or implied. Investing involves risk, including loss of principal. A human must review every plan before any trade. Consult a licensed professional before investing.
